

1.6MHz, 600mA Synchronous Step Down Converter in SOT23-5

FEATURES

- ✂ High Efficiency - Up to 95%
- ✂ Very Low 24 μ A Quiescent Current
- ✂ Guaranteed 600mA Output Current
- ✂ 1.6MHz Constant Frequency Operation
- ✂ Internal Synchronous Rectifier Eliminates Schottky Diode
- ✂ Adjustable Output Voltages From 0.6V to V_{IN}
- ✂ Fixed Output Voltage Options Available
- ✂ 100% Duty Cycle Low-Dropout Operation
- ✂ 0.1 μ A Shutdown Current
- ✂ Tiny SOT23-5 Package

APPLICATIONS

- ✂ Blue Tooth Headsets
- ✂ Portable Audio Players
- ✂ Mobile Phones
- ✂ Wireless and DSL Modems
- ✂ Digital Still Cameras
- ✂ Portable Instruments

GENERAL DESCRIPTION

The LP3202 is a fixed-frequency current-mode synchronous PWM step down converter that is capable of delivering 600mA of output current while achieving peak efficiency of 95%. Under light load conditions, the IL9406 operates in a proprietary pulse skipping mode that consumes just 24 μ A of supply current, maximizing battery life in portable applications. The LP3202 operates with a fixed frequency of 1.6MHz, minimizing noise in noise-sensitive applications and allowing the use of small external components. The LP3202 is an ideal solution for applications powered by Li-Ion batteries or other portable applications that require small board space.

The IL9406 is available in a variety of fixed output voltage options, 1.5V, 1.8V, and 2.5V, and is also available in an adjustable output voltage version capable of generating output voltages from 0.6V to V_{IN} . The LP3202 is available in a tiny 5 pin SOT23-5 package.

PIN CONFIGURATION

PIN DESCRIPTION

PIN NUMBER	PIN NAME	PIN DESCRIPTION
1	EN	Enable Control Input. Drive EN to IN or to a logic high for normal operation, drive to G or a logic low to disable the regulator.
2	G	Ground.
3	SW	Switching Node Output. Connect this pin to the switching end of the inductor.
4	IN	Power Input. Bypass to G as close as possible to the IC with a high quality ceramic capacitor.
5	FB	Feedback Node. For fixed output voltage options, connect this pin directly to the output. For the adjustable output version the voltage at this pin is regulated to 0.6V; connect to this pin to the center of the output voltage feedback network.

LP3202-AD5F

ABSOLUTE MAXIMUM RATINGS

(Note: Exceeding these limits may damage the device. Exposure to absolute maximum rating conditions for long periods may affect device reliability.)

PARAMETER	VALUE	UNIT
IN, FB, EN to G	-0.3 to 6	V
SW to G	-0.3 to $V_{IN} + 0.3$	V
Continuous SW Current	Internally limited	A
Junction to Ambient Thermal Resistance (θ_{JA})	190	°C/W
Maximum Power Dissipation (derate 5.3mW/°C above $T_A = 50^\circ\text{C}$)	0.53	W
Operating Junction Temperature	-40 to 150	°C
Storage Temperature	-55 to 150	°C
Lead Temperature (Soldering, 10 sec)	300	°C

ELECTRICAL CHARACTERISTICS

($V_{IN} = V_{EN} = 3.6\text{V}$, $T_A = 25^\circ\text{C}$ unless otherwise specified.)

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Input Voltage Range	V_{IN}		2.7		5.5	V
Under Voltage Lockout Threshold	V_{UVLO}	V_{IN} rising, hysteresis = 0.1V	2.25	2.4	2.5	V
Operating Supply Current		$V_{FB} = 60\%$, $I_{OUT} = 0$		586		μA
Standby Supply Current		$V_{FB} = 105\%$, $I_{OUT} = 0$		22	33	μA
Shutdown Supply Current		$V_{EN} = 0\text{V}$, $V_{IN} = 4.2\text{V}$		0.1	5	μA
Adjustable Version Regulation Voltage (IL9406UCADJ)	V_{FB}	$T_A = 25^\circ\text{C}$	0.591	0.6	0.609	V
		$0 < T_A < 85^\circ\text{C}$	0.588	0.6	0.612	
		$-40^\circ\text{C} < T_A < 85^\circ\text{C}$	0.582	0.6	0.618	
Fixed Output Regulation Voltage	V_{OUT}	IL9406UC150	1.473	1.5	1.527	V
		IL9406UC180	1.768	1.8	1.832	
		IL9406UC250	2.455	2.5	2.545	
Output Voltage Line Regulation		$V_{IN} = 3\text{V to } 5\text{V}$		0.016	0.4	%/V
Output Voltage Load Regulation		$I_{OUT} = 10\text{mA to } 500\text{mA}$		0.5		%
Inductor Current Limit	I_{LIM}	$V_{IN} = 3.6\text{V}$, $V_{FB} = 90\%$ of $V_{OUT(NOM)}$		0.9		A
Oscillator Frequency	f_{SW}	V_{FB} or V_{OUT} in regulation	1.3	1.6	1.9	MHz
		V_{FB} or $V_{OUT} = 80\%$ of $V_{OUT(NOM)}$		360		kHz
PMOS On Resistance	R_{ONP}	$I_{SW} = -100\text{mA}$		0.37	0.6	Ω
NMOS On Resistance	R_{ONN}	$I_{SW} = 100\text{mA}$		0.36	0.6	Ω
SW Leakage Current		EN = G, $V_{IN} = 5.5\text{V}$, $V_{SW} = 5.5\text{V or } 0\text{V}$			1	μA
EN Logic High Threshold	V_{IH}	$V_{IN} = 2.7\text{V to } 5.5\text{V}$	1.4			V
EN Logic Low Threshold	V_{IL}	$V_{IN} = 2.7\text{V to } 5.5\text{V}$			0.4	V
EN Input Bias Current	I_{EN}	$V_{IN} = 5.5\text{V}$, EN = G or IN		0.01	0.1	μA

FUNCTIONAL DESCRIPTION

CONTROL SCHEME

The LP3202 utilizes a fixed-frequency, current-mode PWM control scheme combined

with fully-integrated power MOSFETs to produce a compact and efficient step-down DC-DC solution. During normal operation the high-side MOSFET turns on each cycle and remains on until the current comparator turns it off. At this point the low-side MOSFET turns on and remains on until either the end of the switching cycle or until the inductor current approaches zero. The error amplifier adjusts the current

comparator's threshold as necessary in order to ensure that the output voltage remains in regulation.

LIGHT-LOAD POWER SAVING OPERATION
When operating under light-load conditions, the IL9406 uses a proprietary and patent-pending control scheme that reduces quiescent supply current to maximize efficiency while maintaining output voltage regulation. Under light load conditions the LP3202 reduces its

switching frequency in order to achieve high efficiency. Whenever the feedback voltage falls below the regulation voltage the high-side MOSFET turns on and remains on for a period of time that is controlled by the LP3202 control circuitry. The duration of the on cycle is dynamically adjusted to maximize efficiency under all load current conditions.

SOFT START

The LP3202 integrates a 50µs soft function that prevents input inrush current and output overshoot during start up.

OVER-CURRENT PROTECTION

The LP3202 has an internal current limit of 900mA, which is detected on a cycle by cycle basis. When this maximum inductor current limit is reached the charging cycle is terminated, and the low-side MOSFET is turned on to allow the inductor current to decrease. Under extreme overloads, such as short-circuit conditions, the LP3202 reduces its oscillator frequency to 360KHz to allow further inductor current reduction and to minimize power dissipation.

APPLICATION INFORMATION

INDUCTOR SELECTION

Under normal operation, the inductor maintains continuous current to the output. This inductor current has a ripple that is dependent on the inductance value: higher inductance reduces the peak-to-peak ripple current. In general, select an inductance value L based on ripple current requirement:

$$L = \frac{V_{OUT} \cdot (V_{IN} - V_{OUT})}{f_{SW} \cdot I_{OUTMAX} \cdot K_{RIPPLE}} \quad (1)$$

where V_{IN} is the input voltage, V_{OUT} is the output voltage, f_{SW} is the switching frequency, I_{OUTMAX} is the maximum output current, and K_{RIPPLE} is the ripple factor. Typically, choose $K_{RIPPLE} = 30\%$ to correspond to the peak-to-peak ripple current being 30% of the maximum output current.

With this inductor value (Table 1), the peak inductor current is $I_{OUT} \cdot (1 + K_{RIPPLE} / 2)$. Make sure that this peak inductor current is less than the 0.9A current limit. Finally, select the inductor core size so that it does not saturate at the current limit value.

Table 1. Typical Inductor Values

V_{OUT}	0.6V to 0.9V	0.9V to 1.8V	>1.8V
L	1.5 μ H	2.2 μ H	2.7 μ H

INPUT CAPACITOR SELECTION

The input capacitor reduces input ripple voltage the converter; a 4.7 μ F ceramic capacitor is recommended for most applications. The input capacitor should be placed as close as possible to IN and G, with short, wide traces.

OUTPUT CAPACITOR SELECTION

A low ESR output capacitor is required to maintain low output voltage ripple. Output ripple voltage is given by:

$$V_{RIPPLE} = I_{OUTMAX} K_{RIPPLE} R_{ESR} + \frac{V_{IN}}{28 \cdot f_{SW}^2 LC_{OUT}} \quad (2)$$

where I_{OUTMAX} is the maximum output current, K_{RIPPLE} is the ripple factor, R_{ESR} is the ESR of the output capacitor, f_{SW} is the switching frequency, L is the inductor value, and C_{OUT} is the output capacitance. In the case of ceramic output capacitors, R_{ESR} is very small and does not contribute to the ripple. Therefore, a lower capacitance value is acceptable when ceramic capacitors are used. A 10 μ F ceramic output capacitor is suitable for most applications.

OUTPUT VOLTAGE PROGRAMMING

Figure 3. Output Voltage Programming

Figure 3 shows the feedback network necessary to set the output voltage when the adjustable version is used. Select the proper pair of the two feedback resistors R_{FB1} and R_{FB2} based on the desired output voltage. Typically choose $R_{FB2} \approx 100k\Omega$ and determine R_{FB1} from the output voltage:

$$R_{FB1} = R_{FB2} \left(\frac{V_{OUT}}{0.6V} - 1 \right) \quad (3)$$

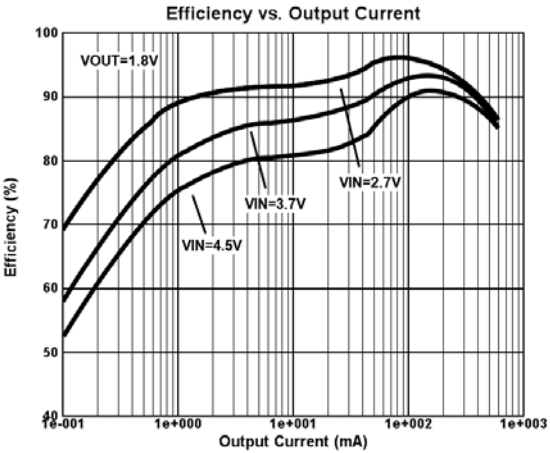

Connect a small capacitor across R_{FB1} for Feed forward capacitance at the FB pin:

$$C_{ff} = 2E - 5/R_{FB1} \quad (4)$$

where $R_{FB1} = 900k\Omega$, use 22pF. When using very low ESR output capacitors, such as ceramic, check for stability while examining load-transient response, and increase the compensation capacitor C1 if needed.

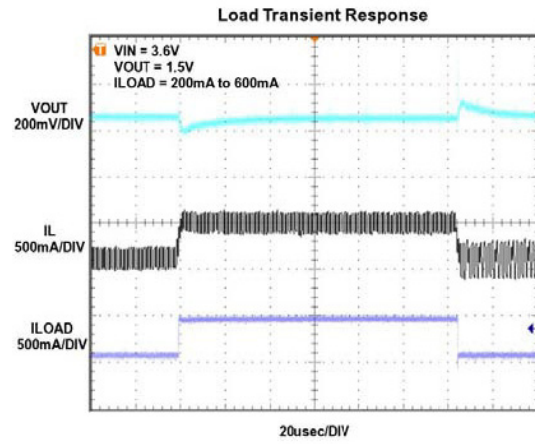

TYPICAL PERFORMANCE CHARACTERISTICS

($V_{IN} = V_{EN} = 3.6V$, $L = 2.2\mu H$, $C_N = 4.7\mu F$, $C_{OUT} = 10\mu F$, unless otherwise specified.)

TYPICAL PERFORMANCE CHARACTERISTICS CONT'D

($V_{IN} = V_{EN} = 3.6V$, $L = 2.2\mu H$, $C_N = 4.7\mu F$, $C_{OUT} = 10\mu F$, unless otherwise specified.)
